                                                                                                                                                                                                    The invention provides a peptide vaccine against P. aeruginosa that comprises a pilin peptide conjugated to a carrier protein. The pilin peptide has one of the four sequences selected from AAY49352-355. The vaccine is used to prevent Pseudomonas infections. The present sequence represents a cell surface binding domain from P. aeruginosa pilin strain PAO.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WO9957142-A2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Vaccine; P. aeruginosa; pilin; Pseudomonas infection; antibacterial; cell surface binding domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Cell surface binding domain from P. aeruginosa pilin strain PAO.

"NMR solution structure and flexibility of a peptide antigen
representing the receptor binding domain of Pseudomonas aeruginosa.";
Biochemistry 32:13442-13440(1993)

-i- SUBUNIT: THE PILI ARE POLAR FLEXIBLE FILAMENTS OF ABOUT 5.4
NANOMETERS DIAMETER AND 2.5 MICROMETERS AVERAGE LENGTH; THEY
CONSIST OF ONLY A SINGLE POLYPEPTIDE CHAIN ARRANGED IN A HELICAL
CONFIGURATION OF FIVE SUBUNITS PER TURN IN THE ASSEMBLED PILUS.

-i- SIMILARITY: BELONGS TO THE N-ME-PHE PILI FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         InterPro; IPR001082; Pilin.

**Mol. Microbiol. 5:561-573(1991).

**ISUBUNIT: THE PILI ARE POLAR FLEXIBLE FILAMENTS OF ABOUT 5.4 WANOMETERS DIAMETER AND 2.5 MICROMETERS AVERAGE LENGTH; THEY CONSIST OF ONLY A SINGLE POLYPEPTIDE CHAIN ARRANGED IN A HELICAL CONFIGURATION OF FIVE SUBUNITS PER TURN IN THE ASSEMBLED PILUS.

**ISUBLELIANEOUS: THE SEQUENCE SHOWN IS THAT OF ISOLATE 265.

**ISINILARITY: BELONGS TO THE N-ME-PHE PILI FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  InterPro; IPR001082; Pilin.

Immun. 67:1393-1404(1999).

-i- FUNCTION: INVOLVED IN A GENERAL SECRETION PATHWAY (GSP) FOR THE EXPORT OF PROTEINS (BY SIMILARITY).

-i- SUBUNIT: THE PILI ARE POLAR FLEXIBLE FILAMENTS OF ABOUT 5.4 WANOMETERS DIAMETER AND 2.5 MICROMETERS AVERAGE LENGTH; THEY CONSIST OF ONLY A SINGLE POLYPEPTIDE CHAIN ARRANGED IN A HELICAL COMPIGURATION OF FIVE SUBUNITS PER TURN IN THE ASSEMBLED PILUS (IN SIMILARITY).

-i- SIMILARITY: BELONGS TO THE FIMBRIAL PROTEIN (N-ME-PHE)PILIN FAMILY.
